The XXXIII ICPIG (International Conference on Phenomena in Ionized Gases) has been organized by Instituto de Plasmas e Fusão Nuclear from Instituto Superior Técnico, Universidade de Lisboa, Universidade do Porto and Universidade do Minho.

The XXXIII ICPIG was organized in accordance with IUPAP principles, regarding the free circulation of scientists for international collaborations and discussions, as stated in the declaration of the International Council of Science, adopted at the 26th General Assembly in 2008 and endorsed by the 27th General Assembly in 2011. In particular, no *bona fide* scientist is excluded from participation on grounds of origin, nationality or political considerations unrelated to science.

Permission to make digital or hard copies of portions of this work for personal or classroom use is granted without fee provided that copies are not made or distributed for profit or commercial advantage. Abstracting is permitted with credit to the source.

- 69 Spectroscopic study of low pressure, low temperature H₂-CH₄-CO₂ microwave plasmas used for large area deposition of nanocrystalline diamond films
Andy S. C. Nave, Benoit Baudrillart, Stephan Hamann, Fabien Bénédict, Guillaume Lombardi, Alix Gicquel, Jean-Pierre H. van Helden and Jürgen Röpcke
- 70 Control methods of RONS in Dielectric Barrier Discharge
Seungmin Ryu, Hyeongwon Jeon, Sangheum Eom, Jungwoo Yoon, Suk Jae Yoo and Seong Bong Kim
- 71 A novel non-invasive technique for detection and analysis of harmonics in Radio Frequency plasmas
Arti Rawat, Ashish Ganguli, Ramesh Narayanan and Ram Dattatraya Tarey
- 72 Active and passive optical diagnostics in a model HV circuit breaker
Emmanouil Panousis, Patrick Stoller, Jan Carstensen, Valeria Teppati, Ralf Methling, Steffen Franke and Sergey Gortschakow
- 73 Photoluminescence of plasma produced graphene quantum dots
Susana Espinho, Neli Bundaleska, Júlio Henriques, Francisco Marques Dias and Elena Tatarova
- 74 Comparative cross-correlation spectroscopy study of positive and negative polarity transient spark discharge in ambient air
Mário Janda, Abdollah Sarani, Tomás[Pleaseinsertintopreamble] Hoder, Torsten Gerling, Ronny Brandenburg and Zdenko Machala
- 75 In-flight modification of metallic nanoparticles by low pressure RF plasma
Ondrej Kylian, Anna Kuzminova, Jan Hanus, Mykhajlo Vaydulych, Choukourov Andrey, Miroslav Cieslar, Danka Slavinska and Hyněk Biederman
- 76 Effect of runaway electron preionization on discharge breakdown in air at atmospheric pressure: simulation study
Zden[Pleaseinsertintopreamble]k Bonaventura, Olivier Chanrion, Anne Bourdon, Francois Pechereau, Fabien Tholin and Torsten Neubert
- 77 Flow characterization of the electro-thermal plume induced by nanosecond repetitively pulsed microplasmas
Thomas Orriere, Nicolas Benard, Eric Moreau and David Z. Pai
- 78 Stark broadening of multiple Ar I lines as a diagnostics tool for transient welding arcs containing metal vapor
Marina Kühn-Kauffedt, José-Luis Marqès and Jochen Schein
- 79 O atom kinetics in CO₂ pulsed glow discharges
Ana-Sofia Morillo-Candas, Bart Klarenaar, Richard Engeln, Abhyuday Chatterjee, Jean-Paul Booth, Vasco Guerra, Tiago Silva and Olivier Guaitella
- 80 Cell death Mechanism on human colorectal cancer after PAM (Plasma Activated Medium) treatment
Julie Chauvin, Florian Judée, Patricia Vicendo, Nofel Merbahi, Marie-Pierre Rols, Laure Gibot, Muriel Golzio and Mohammed Yousfi
- 81 Sensitivity analysis and uncertainty quantification for electric field determination in air from FNS and SPS intensity ratio
Petr Bílek, Adam Obrusník, Tomás[Pleaseinsertintopreamble] Hoder, Milan [Pleaseinsertintopreamble]imek and Zden[Pleaseinsertintopreamble] Bonaventura
- 82 On the influence of ferroelectric materials in a packed-bed DBD reactor
Ana Gómez-Ramírez, Rafael Álvarez, Francisco José García-García, Alberto Palmero, Agustín Rodríguez and José Cotrino
- 83 High Power Impulse Magnetron Sputtering: An overview on the benefits of ultra-short pulse operating mode
Ioana-Laura Velicu, Vasile Tiron and Gheorghe Popa
- 84 Free-standing graphene: synthesis and functionalization using plasma-based methods
Ana Dias, Johannes Berndt, Eva Kovacevic, Cedric Pattyn, Thomas Strunskus, Júlio Henriques and Elena Tatarova
- 85 DBD plasma jet in helium, argon and nitrogen: energy balance and bactericidal activity
Olga Stepanova, Mikhail Pinchuk, Alexander Lazukin, Oksana Rybalchenko, Olga Orlova, Alexander Astafiev and Anatoly Kudryavtsev
- 86 Efficacy of plasma-generated ozone in bioburden decontamination
Malgorzata Pajak, Richard Barton, Declan Diver, Hugh Potts and Andrew Smith
- 87 Surface-wave-sustained plasma for model biological systems treatment
Evgenia Benova, Yana Topalova, Plamena Marinova, Yovana Todorova, Mariana Atanasova, Todor Bogdanov and Ivaylo Yotinov
- 88 Investigation of the excited state population density of Xe plasma by active and passive spectroscopy
Dariya Krivoruchko and Alexander Skrylev

Comparative cross-correlation spectroscopy study of positive and negative polarity transient spark discharge in ambient air

A streamer-to-spark transition in a self-pulsing transient spark (TS) discharge of positive and negative polarity in air was investigated using cross-correlation spectroscopy. The temporal evolution of the TS was recorded for several spectral bands and lines. The results enable the visualization of the different phases of discharge development. In positive polarity, we observed the primary and the secondary streamer, both propagating from the needle anode towards the plane cathode. In the negative polarity, the primary streamer propagating from the needle cathode was followed by the backward propagating streamer. The transition to the spark was not recorded due to relatively long (0.3-1.5 μ s) and irregular streamer-to-spark transition phase.

1. Introduction

The transient spark (TS) is a dc-operated, self-pulsing filamentary discharge [1]. We optically explore the evolution of TS in ambient air in needle-to-plane geometry at mean pulse repetition rate \sim 2-3 kHz. Negative and positive needle polarity are compared. We used cross-correlation spectroscopy (CCS) that provides sufficient spatial and temporal resolution, high sensitivity, and is suitable for the investigation of randomly appearing discharges [2].

2. Results

The temporal evolution of the TS was recorded for several spectral bands and lines: the second positive system SPS of N_2 (337.1 nm), the first negative system FNS of N_2^+ (391.4 nm), and atomic oxygen (777.1 nm).

In the positive polarity, primary and secondary streamers are observed, both propagating from the needle anode towards the planar cathode (Fig. 1). During the primary streamer, the emission of the SPS dominates, but weak emissions of the FNS and O^* are also observed. During the secondary streamer, only SPS emission is obtained. During the streamer-to-spark transition, the emission comes from the atomic lines and the FNS, but no SPS emission was observed.

In the negative polarity, the SPS emission propagating from the needle cathode towards the anode dominates during the initial discharge phase, similar as seen in Trichel pulses. When the SPS emission reaches the anode, the emissions of FNS and O^* appear in the whole gap. In the SPS signal we observed another event moving towards the cathode (Fig. 2), assumed as backward propagating streamer.

Fig. 1: CCS record of the TS evolution, positive polarity.

Fig. 2: CCS record of the TS evolution, negative polarity.
